VIRGIL L. CHURCHILL

Virgil L. Churchill, a valued member of the Station staff for 46 years, died on March 22, 1941.

As sampling agent for this department he was well known to farmers and to manufacturers and dealers of the fertilizer and feed industries of the State on whom he called regularly, taking official samples of their goods for analysis by the Station.

Three features are essential in any plan of inspection and analysis, and they are all equally important. The field sample must be representative of the stock examined; the analysis must be accurate; and the results must be interpreted correctly. Mr. Churchill knew the importance of his part in this program. He did his work faithfully and well, without undue show of authority, and always with consideration for the interest and convenience of those whose premises he visited.

A plain, dependable and good man, Mr. Churchill won the confidence, the trust and the friendliness of all with whom he had to deal. It is a tribute to him as a man and as a public servant that he will be missed by so many — and remembered so long.

Commercial Fertilizers Report for 1941

E. M. BAILEY
Chemist in Charge

LAW AND REGULATIONS REGARDING COMMERCIAL FERTILIZERS

THE term "commercial fertilizers" as used in the Connecticut fertilizer statute includes any and every substance imported, manufactured, prepared or sold for fertilizing or manuring or soil amendment purposes, except barnyard manure and stable manure that have not been artificially treated or manipulated, marl and lime.

The seller is responsible for the proper labelling of each package of fertilizer, for the registration of each brand sold or offered for sale, for the payment of the required analysis fee and for the payment of the tonnage tax. If, however, proper labelling, registration and payments of analysis fees and of tonnage tax have been provided for by the manufacturer or by another responsible person, all sellers of such brands are released from the above mentioned requirements. The retailer, therefore, should assure himself that the requirements of the law have been met by the manufacturer of the brands which he handles, or himself be prepared to meet all these requirements.

It frequently happens that a manufacturer or jobber sells fertilizer materials which are the products of, and which are registered by, another firm or individual. Distributors in such cases should sell such materials by the exact brand names under which they are registered in order that there may be no mistake as to the identity of brands. Any change in the brand names, or failure to make the identity of the brand and its manufacturer clear, makes the distributor liable for the registration of the product as his own brand.

The law exempts from registration, and from other requirements referred to, only (1) fertilizers passing through the State in transit; (2) fertilizers and fertilizer materials shipped to regular fertilizer factories to be used for manufacturing purposes; and (3) fertilizers and fertilizer chemicals sold to the Connecticut Agricultural Experiment Station for experimental purposes.

Cottonseed, linseed and soybean meals, when sold or used for fertilizer purposes, must be registered as fertilizers and the specified fees paid thereon. For such products the registration fee is \$10.00 for each brand payable annually, and six cents per ton tonnage fee, payable semi-annually.

NOTE: Analyses reported in this bulletin were made by Messrs. Nolan, Mathis and Walden; microscopic examinations by Miss Shepard; inspection and sampling by Mr. Nichols; and compilations by Mrs. Vosburgh.

These fees are entirely apart from those required by the feeding stuffs statute.

Because manufacturers or jobbers often do not know how much, if any, of their brands are sold or used as fertilizers, local dealers report their sales to this Station. The information is not for publication but is used to inform manufacturers of the total sales of their brands as fertilizer in this State. It is expected that the fees will be paid by the manufacturers or other party responsible for the brands.

INSPECTION OF 1941

The Station Agent collected 322 official samples of fertilizer including all of the registered brands that could be located. These are summarized, together with unofficial samples submitted by farmers, in the classification list which follows, on page 48.

The tonnage data included in the summary are based on returns made to October 1 of this year and are practically complete. The tonnage represents that which is subject to the provisions of the fertilizer law; it does not include fertilizer materials distributed in the State under the Federal Agricultural Conservation program. The tonnage figures are for the period July 1, 1940 to June 30, 1941.

REGISTRATIONS

Late registrations for 1940

To the brands registered for 1940 in our last report should be added:
Ashcraft-Wilkinson Co., Atlanta, Ga.
 Cottonseed Meal—Castor Pomace Mixture

Registrations for 1941

For 1941, 61 firms and individuals registered 332 brands of fertilizers at this Station for sale in this State. As required by statute, the brands so registered are listed as follows:

The Acme Guano Co., Baltimore, Md.

Acme 3-10-4
 Acme 3-12-6
 Acme 4-8-4
 Acme Vitaflor 4-8-5
 Acme 4-8-10
 Acme 5-8-7
 Acme Plant Food 7-7-7
 Acme 20% Superphosphate

I. RAW MATERIALS CHIEFLY VALUABLE FOR NITROGEN

Nitrate of Soda, etc.

Materials in this group are summarized in Table 1. Guaranties were substantially met or exceeded in all cases.

Samples drawn and submitted by purchasers are not included in the tabulation.

Vegetable Meals

Samples of cottonseed meal-castor pomace 904 to 909 inclusive were drawn from stock of L. B. Haas & Co. The average of 6 samples was 6.01 percent nitrogen, and 7.69 percent moisture. The average of 8 samples drawn and submitted by the purchaser was 6.11 percent nitrogen and 6.57 percent moisture. On a moisture-free basis the agreement between official samples and those submitted by the purchaser is very close, 6.51 percent and 6.54 percent nitrogen respectively. This meal was a Peruvian product.

Analyses of vegetable meals are given in Table 2.

II. RAW MATERIALS CHIEFLY VALUABLE FOR PHOSPHORIC ACID

Superphosphate formerly contained 16 percent of available phosphoric acid but in recent years 20 to 40 percent grades are common. One sample this year contained 47 percent. All samples examined met their guaranties except in two cases where slight deficiencies were noted.

One sample of precipitated bone was below guaranty. An unofficial sample from the same source, however, was not deficient. The stock was exhausted before a second official sample could be obtained.

Min-Coll is a natural phosphate valuable only as a source of total phosphoric acid. The phosphoric acid is largely in citrate-insoluble form.

Analyses of materials in this group are given in Table 3.

III. RAW MATERIALS CHIEFLY VALUABLE FOR POTASH

Official samples of potash salts and of cottonhull ashes are listed in Table 4.

Guaranties were met or exceeded in all samples examined.

The Old Deerfield Fertilizer Co. registered cottonhull ashes 35 percent K_2O . No official samples were secured but several samples submitted by purchasers were analyzed and met the guaranty.

IV. RAW MATERIALS SUPPLYING NITROGEN AND POTASH

No official samples of nitrate of potash were taken, but six samples were examined for purchasers.

One official sample of nitrate of potash-soda, the same registered by the Chilean Nitrate Sales Corp., New York, and sampled from stock of Apothecaries Hall Co., was examined and found to meet the guaranties. Nitrogen found 15.06 percent, guaranteed 15; potash found 15.31 percent, guaranteed 14.

V. RAW MATERIALS SUPPLYING NITROGEN AND PHOSPHORIC ACID

Analyses of official samples of dry ground fish, of tankage and of ground bone are given in Tables 5, 6 and 7, respectively.

One sample of tankage showed a slight deficiency in nitrogen.

Sample 258, steamed bone meal, was deficient in total phosphoric acid. The sample contained 0.7 percent of nitrogen in the form of ammonium salt and some mineral phosphate was present. It was not straight steamed bone. The purchase involved only a one-quarter ton lot.

Ammo-Phos, although not an organic and not included in tabulations above named, may be included in this group as a source of nitrogen and phosphoric acid. One sample taken from stock of Apothecaries Hall Co. was guaranteed nitrogen 11 percent, available P_2O_5 48 percent. It analyzed 10.79 nitrogen and 48.82 P_2O_5 .

VI. MIXED FERTILIZERS

Analyses of 183 official samples of mixed fertilizers are given in Table 8. Results may be summarized as follows:

Total number of samples	183
Samples deficient in	
one item	38
two items	6
three items	0
Percentage of samples meeting guaranties in all items	75
Total guaranties made	547 ¹
Guaranties not met:	
nitrogen	21
phosphoric acid	14
potash	15
Percentage of guaranties met	91

¹Two samples with only two items guaranteed.

Seventy-five percent of the samples analyzed substantially met or exceeded guaranties in all respects; and 91 percent of guaranties made were fulfilled. Only three samples showed commercial deficiencies in excess of \$1.00 per ton. These were 542, Acme 4-8-4, (\$1.29); 809, Armour's 8-16-16 (\$1.62), and 676, G & O 5-8-5, (\$1.65).

The distribution of chemical deficiencies is given in Table 8a. They are notably less than in the two years previous. Deficiencies of 0.1 percent or less in nitrogen, and 0.2 percent or less in available phosphoric acid and potash are not included.

Organic nitrogen of inferior quality was indicated in 861, Plantspur 3-3-2. The nitrogen guaranty is nearly met with nitrogen from ammonium salts; but the activity of the insoluble organic nitrogen was low by both the alkaline and the neutral permanganate methods, 40 and 36 respectively.

Home Mixtures

Analyses of home mixed fertilizer are given in Table 9. For the most part these are formulas for tobacco.

State Purchases of Fertilizer

Fertilizers sold on state purchase orders for the use at state institutions are included in our regular inspection by request of the State Supervisor of Purchases. The fertilizer law provides no exemption from registration and tonnage tax for such sales; the only exemption is for fertilizer sold to the Experiment Station for experimental purposes.

State purchase orders often call for fertilizer mixtures of odd and irregular grades which puts an unwarranted burden upon the manufacturer who must register such brands. The situation would be materially improved if such orders were confined to those grades that have been adopted by agreement among agronomists as serving all practical agricultural needs for our New England area. (See p. 49 of this report).

Samples of goods sold on state purchase orders are indicated by footnotes in the several tables. A summary of them is as follows:

No. of samples	Material	Reference
7	Nitrate of soda, etc.	Table 1
5	Superphosphate, etc.	" 3
3	Potash salts	" 4
1	Bone	" 7
14	Mixed Fertilizers	" 8

All of these samples were of the substance and quality demanded and without significant commercial deficiencies, except the sample of bone which has already been commented upon, p. 52.

VII. MISCELLANEOUS

Analyses of official samples of sheep manure and similar materials are given in Table 10.

Liming materials are not required to be registered in this State but many samples have been examined for purchasers and a few official samples have been drawn. Analyses are given in Table 11.

Thirty-eight samples of other miscellaneous materials have been examined. Some of these are listed in Table 12 for reference purposes.

Sample 1138 was vegetable waste (apparently tea leaf waste) treated with liming material. Such material is sold by itinerant vendors from trucks and is usually brought in from outside the State. It is in a wet

condition and usually contains from 40 to 50 percent of water. Such material, however it may be represented, is not a "fertilizer" in the common understanding of that term, and not accepted for registration under our fertilizer law, because it supplies only an insignificant amount of plant food (nitrogen, phosphoric acid and potash). It does, however, contain a considerable amount of organic matter which has some value as a mulch and as a soil conditioner because of its moisture-holding capacity. Sample 1138, for example, in spite of the fact that it contains 840 lbs. of water to the ton, contains also, 788 lbs. of organic matter. The worth of such organic matter is fairly comparable with that in peat moss or in peat or muck from local deposits. Thus a bushel (weighing about 30 lbs.) would contain about 12 lbs. of organic matter. At 1.25 to 2 cents per pound the purchaser will pay for organic matter at about the same rate that he does when he buys peat moss or swamp muck locally. But clearly it would be better for purchasers to investigate local sources of supply than to absorb the cost of hauling such material from remote places, and assume the risk of uncertain substance and quality of material from unknown sources.

The laboratory has continued to take part in the collaborative programs of the American Oil Chemists Society and of the F. S. Royster Guano Co. and has analyzed 42 samples of cottonseed meal and mixed fertilizers. These programs are participated in by state, commercial and industrial chemists in the interest of uniformity in control work.
